SUMMARY - HUMAN (lol)

For projectv1, I experimented with UI/UX and design, iterating through 15 prototype demos before landing on a final version. For the final five prototypes, I honed in on one design and added Javascript to the HTML/CSS skeleton to begin testing new features and interactive elements.

The main challenge for this version was learning how to work with different models and capture the vision I have in mind. I came in with a clear vision for three pages, but I wanted to experiment with different designs before landing on a final prototype to build out. The design process can be traced through on the gallery homepage. Unfortunately, due to usage limits, I had to move back and forth between Claude and Codex. I found that the Codex model struggled with creativity and experimentation, producing nearly identical initial demos that I was able to push much further out there with Claude.

The two main design paths I pursued were:

1. Veneer -> Violence: Starting with a page that mirrors the Apple UI, have the design deteriorate into a much darker, more emotive final page.
2. Pop-art Zine: Experimental, interactive, using loud bold design choices to drive home the message.

For the final round of prototyping, I focused in on the 'Compliance' design and began introducing more interactive app-like elements. For the final version, I tried to give it a final "polish": smoother transitions, small interactive features to beautify and elevate the design.

For version 2, I'm excited to introduce the following elements:

- Data: Draw from APIs and papers written about conflict minerals / smartphone manufacturing pipelines
- Design: Hand-drawn SVGs to introduce an immersive feel, build in more interactive components.
- Storytelling: Doing my own research and writing to bring out the human element: not just where these minerals come from or how the technology is made, but the stories of the actual people involved in these pipelines
